Babel support for the Greek language

Apostolos Syropoulos, Günter Milde

March 17, 2023

Babel-greek is a contributed package providing support for the Greek language and script via the babel system. See the README file for an overwiew of the babel-greek package and links to requirements and related packages.

The file `babel-greek.dtx`[1] is the literate source for the Babel language definition file `greek.ldf`.

3.3.5 LGR workarounds . . . 12

[1] The file described in this section has version number 1.13.1 and was last revised on 2023/03/17. The original author is Apostolos Syropoulos, code from `kdgreek.sty` by David Kastrup was used.

3.4 Definitions for the Greek language 13
3.4.1 Auto-strings for Greek 14
3.4.2 Auto-strings for polytonic Greek 15
3.4.3 Auto-strings for ancient Greek 15
3.4.4 Date specification 16
3.4.5 Greek numerals 18
3.5 Character codes 21
3.6 Symbol name aliases 24

1 Requirements

Typesetting Greek with Babel requires (of course) the babel package, support for Greek font encodings (greek-fontenc) and a text font supporting the Greek script.

The CB Greek fonts created by Claudio Beccari[2] are a complete set of 8-bit TEX fonts matching Knuth's Computer Modern. The package cbfonts-fd sets them up as Greek substitute for the Computer Modern and Latin Modern font families. The standard `\DeclareFontFamilySubstitution` macro can be used to set up Greek supplements for other TEX font families (like Times or Palatino).

Unicode fonts (used with XeTeX or LuaTeX) provide slots for all Unicode characters in one font but commonly only a subset of the actual glyphs. **Many Unicode fonts, including the default Latin Modern, do not support the Greek script!** Authors need to set up an alternative font like CM Unicode, Linux Libertine, or DejaVu with fontspec or the babel font configuration system.

With 8-bit TeX and XeTeX, hyphenation patterns must be pre-loaded in the format file. This is a limitation by TeX, common to all languages. The LuaTeX engine loads hyphenation patterns dynamically.

2 Usage

To activate Greek language support with babel, specify the option greek, either as global option or as option to the babel package. Remember, that the *last* language option determines the document language, e.g.

```
\usepackage[greek,english]{babel}
```

activates support for Greek text parts in an English document.

`\selectlanguage` `\foreignlanguage`

The Babel core provides two commands to switch the active language: The declaration `\selectlanguage{greek}` switches to the Greek language. The macro `\foreignlanguage{greek}{<some text>}` sets its second argument in the Greek language. This is intended for short text parts. For details see the babel documentation.

[2] Apostolos Syropoulos wishes to thank Claudio Beccari for his patience, collaboration, comments and suggestions.

2.1 Language attributes

The attributes polutoniko[3], and ancient allow the specification of the used orthography. The language variant affects automatic hyphenation, spelling of autogenerated strings and support for multi-accented letters.

The default is modern *monotonic* Greek, while

```
\usepackage[english,greek]{babel}
\languageattribute{greek}{polutoniko}
```

sets the document language to modern Greek with *polytonic* spelling and

```
\usepackage[english,greek]{babel}
\languageattribute{greek}{ancient}
```

sets the document language to *ancient* Greek.

Both attributes may also be used as modifiers as in

```
\usepackage[greek.polutoniko,english]{babel}
```

and similarly

```
\usepackage[greek.ancient,english]{babel}
```

The keep-semicolon language attribute (new in babel-greek 1.13) ensures that a SEMICOLON character (;) can be used as input for the similar looking Greek question mark (*erotimatiko*). By default, the LGR font encoding uses the QUESTION MARK (?) as input for the *erotimatiko* and maps the SEMICOLON to an *ano teleia* (·).

2.2 Modifiers

Modifiers cannot be set with `\languageattribute`. Misspelled modifiers are ignored without warning!

Some workarounds for the non-standard LGR font encoding may have serious side-effects. The local-LGR-fixes modifier restricts the re-definitions in section 3.3.5 to text parts using the Greek language. The no-LGR-fixes modifier disables them completely. You may try, e.g.,

```
\usepackage[greek.local-LGR-fixes,english]{babel}
```

as a last ressort if the workarounds make a document uncompilable and using Xe/LuaTeX with Unicode fonts is not an option. Check for problems with enumerations in Greek text parts and with Roman and Greek numerals everywhere (especially in the ToC). These modifiers are provisional, naming and behaviour may change.

2.3 Language hooks

\extrasgreek
\noextrasgreek

The macro \extrasgreek is called by babel on every switch of the active language to Greek. The macro \noextrasgreek is called when switching away from Greek. Package and document authors can add setup and tear-down code to the hooks with the help of the \addto command provided by babel. The first call of \addto\<hookname>{<code>} initializes the hook, subsequent calls append <code> to its definition.

Babel-greek uses these hooks to, e.g, select correct hyphenation patterns (cf. section 3.1) or ensure a font encoding supporting the Greek script is used for Greek text parts (cf. section 3.3).

2.4 Input of Greek text

There are several alternatives to write Greek text.

- Literal input using the UTF-8 encoding is the standard input method. With 8-bit TeX, this requires the package greek-inputenc and special handling for Latin letters and some symbols (consider using the keep-semicolon attribute).

  With the packages inputenc and greek-inputenc, literal Greek characters can also be input using the legacy encodings *iso-8859-7* and *macgreek*.

- The Latin transliteration defined by the LGR font encoding is explained in the file usage.pdf.

- The package greek-fontenc defines *LaTeX internal character representation* (LICR) macros for Greek letters and text symbols. It is required by babel-greek. The LICR macros \textAlpha ... \textomega are a safe but cumbersome method to input Greek characters.

- The alphabeta package, bundled with greek-fontenc, makes the short macro names \Alpha ... \omega available in both, text and math mode.

2.5 Greek vs. Latin script

When switching the language to Greek, babel-greek ensures that the Greek script is supported. The following macros allow the use of Greek vs. Latin script without changing the active language:

\greekscript
\greektext

The *TextCommand*[4] \greekscript switches to a font encoding supporting the Greek script. The declaration \greektext always switches the font encoding to LGR. Both declarations do not change the active language.

\latintext

\latintext (defined by the Babel core, deprecated since March 2014) can be used to switch back to an encoding supporting the Latin script.

\ensuregreek

The function \ensuregreek takes one argument which is typeset using a font

[3] with the alias polytonic

[4] For a discussion of TextCommands, see the *LaTeX font guide*.

encoding supporting the Greek script. It only switches the font encoding if required (i.e. if the current font encoding does not support Greek letters and symbols).

`\lgrfont` The function `\lgrfont`[5] switches to the non-standard Greek 8-bit font encoding LGR. Hint: Use `\lgrfont`, if you want to use the *Latin transliteration* input method and `\ensuregreek` else.

`\ensureascii` The Babel core defines `\ensureascii` that typesets its argument using an ASCII-compatible "standard text font encoding". It is the recommended way for text parts requiring Latin letters but no language switch.

2.6 Greek numbering

The Greek (Milesian) alphabetical numbering system[6] is still used in everyday life for short enumerations. It was used for dates and numbers in the range of several thousands in official editions up to the beginning of the 20th century and is still used by the Eastern Orthodox Church and certain scholars. Unfortunately, most Greeks don't know how to write Greek numbers bigger than 20 or 30.

`\greeknumeral` `\Greeknumeral` The command `\greeknumeral` makes it possible to typeset Greek numerals for numbers up to 999 999. `\Greeknumeral` is the "uppercase" version of this macro. Here are the conventions:

- There is no Greek numeral for any number less than or equal to 0.
- Numbers from 1 to 9 are denoted by letters *alpha*, *beta*, *gamma*, *delta*, *epsilon*, *stigma*[7], *zeta*, *eta*, *theta*, followed by a *keraia*, a mark similar to the mathematical symbol "prime".
- Decades from 10 to 90 are denoted by letters *iota*, *kappa*, *lambda*, *mu*, *nu*, *xi*, *omikron*, *pi*, *koppa*[8], again followed by the numeric mark.
- Hundreds from 100 to 900 are denoted by letters *rho*, *sigma*, *tau*, *upsilon*, *phi*, *chi*, *psi*, *omega*, *sampi*, followed by the numeric mark.
- Any number between 1 and 999 is obtained by a group of letters denoting the hundreds decades and units, followed by a numeric mark.
- To denote thousands one uses the same method, but this time the mark is an *aristeri keraia*, a prime inverted by 180 degrees and placed in front of the letter, under the baseline. When a group of letters denoting thousands is followed by a group of letters denoting a number under 1000, both marks are used.

The shape of the obsolete characters used for number 6 (*digamma*/*stigma*) and 90 (*koppa*) evolved over time and different characters are in use for them today. The following four macros can be re-defined to configure `\greeknumeral` and `\Greeknumeral` respectively:

`\greeknumeralsix` Originally, the sixth letter of the alphabet, standing for 6, was the *digamma*

[5] The legacy name `\textgreek` is available as alias.
[6] Attic numerals, which predate the Milesian numerals are implemented in package `athnum`.
[7] cf. `\greeknumeralsix`
[8] cf. `\greeknumeralninety`

– just as its Latin equivalent F is the sixth letter of the Latin alphabet. As Greek script turned to uncial and then lowercase, digamma changed its shape – it became similar to the ligature for sigma-tau (*stigma*). People started using the stigma or the digraph sigma tau[9]. The macro `\greeknumeralsix` allows configuring the symbol for the number 6 in `\greeknumeral`, the macro `\greeknumeralSix` does the same for `\Greeknumeral`. The default values are `\textstigma` and `\textStigma`.

`\greeknumeralsix`
`\greeknumeralSix`

Three symbols are in use for the number 90: Classicists prefer the q-like "archaic" *koppa* and, more rarely, its uncial form[10], modern Greek uses the zig-zag shaped "modern" *koppa* exclusively. The macro `\greeknumeralninety` allows configuring the symbol for the number 90 in `\greeknumeral`, the macro `\greeknumeralNinety` does the same for `\Greeknumeral`. The default values are `\textkoppa` and `\textKoppa` for modern Greek and `\textqoppa` and `\textqoppa` for ancient Greek.

`\greeknumeralninety`
`\greeknumeralNinety`

There is no such variation in the shape of the *sampi* used for the number 900.

3 Implementation

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```
1 ⟨*code⟩
2 \LdfInit\CurrentOption{captions\CurrentOption}
```

When the option polutonikogreek was used, redefine `\CurrentOption` to prevent problems later on.

```
3 \gdef\CurrentOption{greek}
```

Set up the Babel shorthands feature. It is used later to insert literal `~` characters with polytonic Greek and LGR and to prevent LGR converting a literal semicolon `;` to an *ano teleia* ·.

```
4 \addto\extrasgreek{\languageshorthands{greek}}
```

3.1 Hyphenation patterns

When this file is read as an option, i.e. by the `\usepackage` command, `greek` could be an 'unknown' language in which case we have to make it known. So we check for the existence of the three variants of the Greek language `\l@greek`, `\l@monogreek`, and `l@ancientgreek` and set the hyphenation to `\language0` for the missing ones.

```
5 \ifx\l@greek\@undefined
6   \@nopatterns{greek}
7   \adddialect\l@greek 0
8 \fi
```

[9] Mainly because the letter stigma is not always available, so people opted to write down the first two letters of its name instead.

[10] resembling CYRILLIC LETTER KOPPA or GOTHIC LETTER NINETY

```
\ifx\l@monogreek\@undefined
  \@nopatterns{greek}
  \adddialect\l@monogreek 0
\fi
\ifx\l@ancientgreek\@undefined
  \@nopatterns{greek}
  \adddialect\l@ancientgreek 0
\fi
\newcount\bbl@monogreek \bbl@monogreek=\l@monogreek
\newcount\bbl@polygreek \bbl@polygreek=\l@greek
\newcount\bbl@ancientgreek \bbl@ancientgreek=\l@ancientgreek
```

Use the *language hooks* (cf. section 2.3) to set the correct hyphenation patterns. (We collect setup code for the language variants polutoniko and ancient in `\extraspolutonikogreek` and `\extrasancientgreek`; their content is added to `\extrasgreek` by the respective language attributes, cf. section 3.2).

`\extraspolutonikogreek`
`\extrasancientgreek`

```
\addto\extrasgreek{\let\l@greek=\bbl@monogreek}
\addto\extraspolutonikogreek{\l@greek=\bbl@polygreek}
\addto\extrasancientgreek{\l@greek=\bbl@ancientgreek}
```

`\providehyphenmins`

The macro `\providehyphenmins` is used to set the correct values of the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`. Yannis Haralambous has suggested the value 1.

```
\providehyphenmins{\CurrentOption}{\@ne\@ne}
```

3.2 Language attributes

The Babel core provides the command `\bbl@declare@ttribute` for the declaration of language attributes in language definition files. It takes three arguments: the name of the language, the attribute to be defined, and the code to be executed when the attribute is to be used. If the language attribute is selected, the third argument is executed after reading the *.ldf file.

3.2.1 polutoniko

The `polutoniko` language attribute selects the "polytonic" spelling.

We use an auxiliary function for the setup part used with several attributes. This code adds the expansion of `\extraspolutonikogreek` to `\extrasgreek` to set up support for multi-accented characters and hyphenation patterns for the polytonic orthography.

```
\def\bbl@greek@setup@polytonic{%
  \expandafter\addto\expandafter\extrasgreek
  \expandafter{\extraspolutonikogreek}%
```

It also uses polytonic spelling for auto-strings (captions and month names) and changes the expansion of the character from "protected space" to "self-insert" if the `\greekfontencoding` is LGR (for use as perispomeni in the Latin transliteration).

```
  \let\captionsgreek\captionspolutonikogreek
  \let\gr@month\gr@polutoniko@month
  \def\bbl@tempa{LGR}
  \ifx\greekfontencoding\bbl@tempa
    \declare@shorthand{greek}{~}{\bbl@greek@tilde}
  \fi
}
```

Now declare the option. For backwards compatibility, modern Greek with "polytonic" spelling can also be selected via the dummy language polutonikogreek. However, it is not possible to use both options, greek and polutonikogreek in one document. We also define aliases to allow language switching commands using the language name `polutonikogreek`:

```
\bbl@declare@ttribute{greek}{polutoniko}{%
  \bbl@greek@setup@polytonic
  \let\l@polutonikogreek\l@greek
  \let\datepolutonikogreek\dategreek
  \let\extraspolutonikogreek\extrasgreek
  \let\noextraspolutonikogreek\noextrasgreek
}
```

3.2.2 polytonic

The `polytonic` language attribute is an alias for the attribute `polutoniko` matching the spelling for this orthography variant in polyglossia and Babel `*.ini` files.

```
\bbl@declare@ttribute{greek}{polytonic}{%
  \bbl@greek@setup@polytonic
}
```

3.2.3 ancient

The ancient language attribute is used for classical Greek. This attribute adds the expansion of `\extraspolutonikogreek` and `\extrasancientgreek` to `\extrasgreek` to set up support for multi-accented characters and ancient hyphenation patterns.

```
\bbl@declare@ttribute{greek}{ancient}{%
  \bbl@greek@setup@polytonic
  \expandafter\addto\expandafter\extrasgreek
    \expandafter{\extrasancientgreek}%
```

Auto-strings (captions) are specific to ancient Greek while `\today` uses modern polytonic month names (as there existed incompatible sets of month names and no common calendar in ancient Greece).

```
  \let\captionsgreek\captionsancientgreek
```

Classicists tend to use the Q-like "archaic" koppa for the number 90. Thus, for classical Greek, we set the default to the "archaic" koppa (cf. section 2.6).

```
  \renewcommand{\greeknumeralninety}{\textqoppa}%
  \renewcommand{\greeknumeralNinety}{\textQoppa}%
}
```

3.2.4 keep-semicolon

The LGR font encoding uses the Latin question mark as input for the Greek question mark (*erotimatiko*) and maps the semicolon to a middle dot (*ano teleia*). As a result, Unicode-encoded texts that use the semicolon (;) as *erotimatiko* end up with an *ano teleia* (·) in its place!

With the `keep-semicolon` language attribute, 003B SEMICOLON is made active and inserts an *erotimatiko* also with LGR encoded fonts:

```
\bbl@declare@ttribute{greek}{keep-semicolon}{%
  \def\bbl@tempa{LGR}
  \ifx\greekfontencoding\bbl@tempa
    \ProvideTextCommandDefault{\textsemicolon}{;}
    \ProvideTextCommand{\textsemicolon}{LGR}{\texterotimatiko}
    \initiate@active@char{;}
    \addto\extrasgreek{\bbl@activate{;}}
    \addto\noextrasgreek{\bbl@deactivate{;}}
    \declare@shorthand{greek}{;}{\TextOrMath{\textsemicolon}{;}}
  \fi
}
```

3.3 Font setup

3.3.1 Greek font encoding

`\greekfontencoding` The macro `\greekfontencoding` holds the name of the font encoding[11] used to ensure support of the Greek script. The default is LGR for 8-bit TeX and TU for Xe/LuaTeX.[12] It can be overridden defining `\greekfontencoding` with a custom value before loading babel.

Also store the name of the *encoding definition file*[13] with the extended Greek setup for the Greek font encoding.

```
\ifdefined\UnicodeEncodingName % set by XeTeX/LuaTeX
  \providecommand*{\greekfontencoding}{\UnicodeEncodingName}
  \providecommand*{\bbl@greek@fontencdef}{tuenc-greek}
\else
  \providecommand*{\greekfontencoding}{LGR}
  \providecommand*{\bbl@greek@fontencdef}{lgrenc}
  % TODO the more generic version fails :(
  % \edef\bbl@greek@fontencdef{\lowercase{\greekfontencoding}enc}
\fi
```

3.3.2 Ensure loading of Greek font encoding definitions.

If the *encoding definition file* for `\greekfontencoding` is not yet loaded, do this now:

[11] cf. encguide.pdf

[12] Document authors must ensure that the selected font actually contains the required glyphs. LGR-encoded fonts can be used alongside Unicode fonts with XeTeX/LuaTeX to enable the input of Greek letters via the Latin transliteration (with some limitations, see `test-greek.tex`).

[13] see fntguide.pdf

```
\@ifl@aded{def}{\bbl@greek@fontencdef}{}
{% else
  \InputIfFileExists{\bbl@greek@fontencdef .def}{}
  {% else
    \bbl@error{Font support for the Greek script missing.\\
               babel-greek can't typeset Greek.\\
               Install the "greek-fontenc" package\\
               or use XeTeX/LuaTeX with polyglossia.}
              {I can't find the \bbl@greek@fontencdef .def file
               for the Greek fonts (encoding \greekfontencoding)}
    \@@end
  }
}
```

If the PU font encoding is defined (by hyperref), load extended Greek support for it. Do this in the `\AtBeginDocument` hook because documents may load hyperref after babel. We cannot rely on `@` being a letter when the hook is called and we must not use `\makeatother` in the hook (explanation at stackexchange). We use a temporary function to save and restore the previous catcode.

```
\AtBeginDocument{%
  \@ifl@aded{def}{puenc}%
    {\@ifl@aded{def}{puenc-greek}
       {}%
       {\edef\RestoreAtCatcode{\catcode`@=\the\catcode`@\relax}%
        \makeatletter
        \InputIfFileExists{puenc-greek.def}%
          {}%
          {\bbl@warning{I cannot find the "puenc" Greek fixes
                        from "greek-fontenc".}%
          }%
        \RestoreAtCatcode
       }%
    }% end "puenc.def loaded" branch
    {}% empty "puenc.def not loaded" branch
}
```

3.3.3 Font encoding switches

`\greekscript` The TextCommand[14] `\greekscript` is a declaration that switches the font encoding to `\greekfontencoding`. The extended Greek font encoding definitions from greek-fontenc define empty local variants for TU, LGR, and PU, so that the declaration does nothing if the active font encoding supports the Greek script.

```
\ProvideTextCommandDefault{\greekscript}{%
  \fontencoding{\greekfontencoding}\selectfont
  \def\encodingdefault{\greekfontencoding}}
```

`\ensuregreek` The TextCommand `\ensuregreek` sets its argument in `\greekfontencoding` if the current font encoding does not provide a (typically empty) local variant.

[14] See fntguide.pdf for more info about *TextCommands*.

```
\ProvideTextCommandDefault{\ensuregreek}[1]{%
  \leavevmode {\greekscript #1}}
```

\BabelGreekRestoreFontEncoding The declaration \BabelGreekRestoreFontEncoding changes the font encoding to the value it had before the switch to the Greek language. It does nothing, if the language switch did not trigger a font encoding switch.

```
\def\BabelGreekRestoreFontEncoding{%
  \ifx\cf@encoding\BabelGreekPreviousFontEncoding
  \else
    \let\encodingdefault\BabelGreekPreviousFontEncoding
    \fontencoding{\encodingdefault}\selectfont
  \fi
}
```

Add font encoding switches to the language hooks (cf. section 2.3) to ensure a font encoding supporting the Greek script is used in Greek text parts:

```
\addto\extrasgreek{%
  \let\BabelGreekPreviousFontEncoding\cf@encoding
  \greekscript}
\addto\noextrasgreek{\BabelGreekRestoreFontEncoding}
```

3.3.4 Additional commands for the LGR font encoding

The actions in this section add "harmless" setup steps for the LGR font encoding that cannot be done in the `lgrenc.def` encoding definition file.

We do this only, if the LGR font encoding is defined (either by fontenc or babel-greek), but also if it is not the \greekfontencoding:

```
\@ifl@aded{def}{lgrenc}{%
```

\greektext The declaration \greektext switches to LGR. Use this if you explicitly require LGR (e.g. to use the Latin transliteration or special fonts). Use \greekscript instead, if you want to avoid a font encoding change if the current font encoding already supports the Greek script (e.g. TU). For shorter pieces of text, the \lgrfont (see below) or \ensuregreek commands should be used. Cf. section 3.3.3.

```
  \DeclareRobustCommand{\greektext}{%
    \fontencoding{LGR}\selectfont
    \def\encodingdefault{LGR}}
```

\lgrfont This command takes an argument which is typeset using the LGR font encoding.

The original name \textgreek is deprecated because of its ambiguitiy: The command does not change the text *language* but only the font encoding, which allows the use of the Greek *script* but does not activate Greek hyphenation and case-changing rules.

```
  \DeclareTextFontCommand{\lgrfont}{\greektext}
  \let\textgreek\lgrfont
```

\textol The CB Greek fonts contain an outline family. In order to make it available, we define the command \textol. (This font-specific macro does not fit in a language definition file and is only kept for backwards compatibility.)

```
\def\outlfamily{\usefont{LGR}{cmro}{m}{n}}
\DeclareTextFontCommand{\textol}{\outlfamily}
```

Add LGR-specific variants to some *TextCommands* that use Latin characters in their default definition. These definitions cannot be done in lgrenc.def because they rely on \ensureascii (defined by babel).

```
\ProvideTextCommand{\textcopyright}{LGR}{\ensureascii{\textcopyright}}
\ProvideTextCommand{\textregistered}{LGR}{\ensureascii{%
                                                \textregistered}}
\ProvideTextCommand{\texttrademark}{LGR}{\ensureascii{\texttrademark}}
```

\textampersand LGR has a "middle dot" glyph at the place of the ampersand. Provide the *TextCommand* \textampersand and an LGR-specific version. It is used in the next section to define a version of \& that also works in LGR.

```
\let\bbl@greek@original@amp\&
\ProvideTextCommandDefault{\textampersand}{\bbl@greek@original@amp}
\ProvideTextCommand{\textampersand}{LGR}{%
  \ensureascii{\bbl@greek@original@amp}}
```

\EnsureStandardFontEncoding The TextCommand \EnsureStandardFontEncoding can be used to make existing commands "LGR-proof". It makes sure its argument is typeset using a standard text font encoding. The default is an empty command: almost all commonly used font encodings are standard text encodings – LGR is the notable exception. The local LGR variant uses \ensureascii from the Babel core that comes with elaborate heuristics to select a suitable standard font encoding. A special clause for hyperref avoids warnings from this package.

```
\ProvideTextCommandDefault{\EnsureStandardFontEncoding}{\@firstofone}
\ProvideTextCommand{\EnsureStandardFontEncoding}{LGR}[1]{%
                                                \ensureascii{#1}}
\AtBeginDocument{\@ifpackageloaded{hyperref}
                    {\pdfstringdefDisableCommands{%
                        \let\EnsureStandardFontEncoding\@firstofone}}
                    {}}
```

End the LGR additions block:

```
}{}
```

3.3.5 LGR workarounds

The following redefinitions work around problems with the non-standard LGR font encoding. As they may have serious side-effects, they are only done if LGR is the default Greek font encoding (cf. section 3.3.1).

As an emergency measure, the local-LGR-fixes or no-LGR-fixes modifiers (cf. section 2.2) can be used to restrict the "roman" redefinitions to text parts using the Greek language or skip them completely.

To prevent Roman numerals being typeset with Greek letters in text parts using the LGR font encoding, they must be wrapped in `\ensureascii`. However, Roman numerals are also auto generated by LaTeX and used in moving arguments.[15] These "moving" Roman numbers must be LGR-proofed also if they originate from a text part using a standard font encoding. This can only be ensured by a global re-definition of the generating functions `\@roman` and `\@Roman`. On the other hand, the re-definition breaks the assumption by MakeIndex, that page numbers are plain character sequences. Hyperref assumes that `\thepage` is expandable and doesn't contain formatting instructions (cf. Babel issue #170).

The ampersand macro `\&` is used in both, text and math mode. Let it use the new defined *TextCommand* `\textampersand` in text mode.

```
\def\bbl@tempa{LGR}
\ifx\greekfontencoding\bbl@tempa
  \def\bbl@greek@roman#1{\expandafter\EnsureStandardFontEncoding%
                         \expandafter{\romannumeral#1}}

3.4 Definitions for the Greek language

The next step consists in defining macros for the requirements of Greek typesetting which will later be added to the language switch hooks.

[15] For example, Roman page numbers are generated at "unpredictable" positions and can move to the ToC, (hyper)references, or an index.

3.4.1 Auto-strings for Greek

\captionsgreek The macro \captionsgreek defines all strings used in the four standard document classes provided with LaTeX.

```
\addto\captionsgreek{%
  \def\prefacename{\textPi\textrho\acctonos\textomicron\textlambda
    \textomicron\textgamma\textomicron\textfinalsigma}%
  \def\refname{\textAlpha\textnu\textalpha
    \textphi\textomicron\textrho\acctonos\textepsilon\textfinalsigma}%
  \def\abstractname{\textPi\textepsilon\textrho\acctonos\textiota
    \textlambda\texteta\textpsi\texteta}%
  \def\bibname{\textBeta\textiota\textbeta\textlambda\textiota
    \textomicron\textgamma\textrho\textalpha\textphi\acctonos
    \textiota\textalpha}%
  \def\chaptername{\textKappa\textepsilon\textphi\acctonos\textalpha
    \textlambda\textalpha\textiota\textomicron}%
  \def\appendixname{\textPi\textalpha\textrho\acctonos\textalpha\textrho

```

3.4.2 Auto-strings for polytonic Greek

\captionspolutonikogreek

For texts written in polytonic greek, the translations are the same as above, but some words are spelled differently. For now we just add extra definitions to \captionsgreek in order to override the earlier definitions.

```
\let\captionspolutonikogreek\captionsgreek
\addto\captionspolutonikogreek{%
  \def\refname{\accpsili\textAlpha\textnu\textalpha
    \textphi\textomicron\textrho\accvaria\textepsilon\textfinalsigma}%
  \def\indexname{\textEpsilon\accdasia\textupsilon\textrho\textepsilon
    \texttau\acctonos\texteta\textrho\textiota\textomicron}%
  \def\figurename{\textSigma\textchi\accperispomeni\texteta\textmu
    \textalpha}%
  \def\headtoname{\textPi\textrho\accvaria\textomicron\textfinalsigma}%
  \def\alsoname{\textbeta\textlambda\acctonos\textepsilon\textpi
    \textepsilon{} \accpsili\textepsilon\textpi\acctonos\textiota
    \textsigma\texteta\textfinalsigma}%
  \def\proofname{\accpsili\textAlpha\textpi\acctonos\textomicron
    \textdelta\textepsilon\textiota\textxi\texteta}%
}
```

3.4.3 Auto-strings for ancient Greek

\captionsancientgreek

For texts written in ancient Greek, we took the translations from Apostolos Syropoulos' xgreek package. For now we just add extra definitions to \captionsgreek in order to override the earlier definitions.

```
\let\captionsancientgreek\captionsgreek
\addto\captionsancientgreek{%
  \def\prefacename{\textPi\textrho\textomicron\textomicron
    \acctonos\textiota\textmu\textiota\textomicron\textnu}%
  \def\refname{\accpsili\textAlpha\textnu\textalpha\textphi\textomicron

      \textrho\acctonos\textiota\textomicron\textupsilon \or
    \textDelta\textepsilon\textkappa\textepsilon\textmu
      \textbeta\textrho\acctonos\textiota\textomicron\textupsilon
  \fi
}
```

`\dategreek` The macro `\dategreek` redefines the command `\today` to produce greek dates. The name of the month is produced by the macro `\gr@month` since it is also needed in the definition of the macro `\Grtoday`.

```
\def\dategreek{%
  \def\today{\number\day \space \gr@month\space \number\year}}
```

\Grtoday The macro \Grtoday produces the current date, only that the month and the day are shown as greek numerals instead of arabic as it is usually the case.

```
\def\Grtoday{%
  \expandafter\Greeknumeral\expandafter{\the\day}\space
  \gr@polutoniko@month \space
  \expandafter\Greeknumeral\expandafter{\the\year}}
```

3.4.5 Greek numerals

\greeknumeralsix \greeknumeralSix \greeknumeralninety \greeknumeralNinety The shape of the obsolete characters used for number 6 (digamma/stigma) and 90 (koppa) evolved over time and different characters are in use for them today. We define placeholders that allow configuration by the user or a package.

```
\providecommand*{\greeknumeralsix}{\textstigma}
\providecommand*{\greeknumeralSix}{\textStigma}
\providecommand*{\greeknumeralninety}{\textkoppa}
\providecommand*{\greeknumeralNinety}{\textKoppa}
```

\greeknumeral The commands \greeknumeral and \Greeknumeral produce the lowercase and uppercase Greek numerals respectively.

The command \greeknumeral needs to be *fully* expandable in order to get the right information in auxiliary files. It should also be usable in PDF-strings. Therefore we use the implementation from the \HyPsd@GreekPatch in hyperref (version 7.00e 2020-05-15).

```
\def\greeknumeral#1{%
  {\greekscript
   \bbl@greek@GreekNum\@firstoftwo{#1}}%
}
```

\Greeknumeral The command \Greeknumeral prints uppercase greek numerals.

```
\def\Greeknumeral#1{%
  {\greekscript
   \bbl@greek@GreekNum\@secondoftwo{#1}}%
}
```

\bbl@greek@ill@value When the argument of \greeknumeral has a value outside of the acceptable bounds ($0 < x < 999999$) a warning will be issued (and the argument be printed).

```
\def\bbl@greek@ill@value#1{%
  \PackageWarningNoLine{babel}{Illegal value (#1) for greeknumeral}%
  \@arabic{#1}%
}
```

\bbl@greek@GreekNum \bbl@greek@@GreekNum \bbl@greek@GreekNumI \bbl@greek@GreekNumII \bbl@greek@GreekNumIII \bbl@greek@GreekNumIV \bbl@greek@GreekNumV \bbl@greek@GreekNumVI The auxiliary macros provide the actual conversion. They are taken from hyperref as well.

```
\def\bbl@greek@GreekNum#1#2{%
    \ifnum#2<\@ne
      \bbl@greek@ill@value{#2}%

`\greek@alph` `\greek@Alph`

In the previous release of this language definition file the commands `\greek@aplh` and `\greek@Alph` were kept just for reasons of compatibility. Here again they become meaningful macros. They are defined in a way that even page numbering with greek numerals is possible.

We define the Greek versions; the additional `\expandafter`s are needed in order to make sure the table of contents will be correct, e.g., when we have appendixes.

```
\def\greek@alph#1{\expandafter\greeknumeral\expandafter{\the#1}}
\def\greek@Alph#1{\expandafter\Greeknumeral\expandafter{\the#1}}
```

Redefine the internal macros `\@alph` and `\@Alph` in the language hook, so that we use Greek numerals[16] instead of the Latin alphabet[17] in Greek text parts.

```
\addto\extrasgreek{%
  \babel@save\@alph
  \babel@save\@Alph
  \let\@alph\greek@alph
  \let\@Alph\greek@Alph
}
```

3.5 Character codes

Greek letters drop diacritics (eccept dialytika and sub-iota) in UPPERCASE. This is not cared for by the Unicode standard. The file `greek-euenc.def` from greek-fontenc contains the required `\lccode` and `\uccode` corrections from the xgreek package by Apostolos Syropoulos. It is loaded if the Greek font encoding is TU (i.e. with XeTeX/LuaTeX), see section 3.3.2.

If the Greek font encoding is LGR, character code changes are done here because they must be restricted to text parts using the LGR encoding.

```
\def\bbl@tempa{LGR}
```

[16] cf. section 3.4.5

[17] Eventually interpreted as Latin transliteration and converted to Greek letters in a "strange" order.

```
\ifx\greekfontencoding\bbl@tempa
```

In order to get correct hyphenation we need to set the lower case code of a number of characters.

In LGR encoded fonts, diacritics can be obtained using Knuth's ligature mechanism (see usage.pdf). This means that the characters `<`, `>`, `~`, `‘`, `’`, `"`, and `|` may be part of a word. Therefore, their `\lccode` is changed when polytonic Greek is in effect. For monotonic Greek, we only need `’` and `"`.

The 'v' character has a special usage in LGR-encoded fonts: The LGR ligature mechanism detects the end of a word and assures that a final sigma (ς) is used. The 'v' after an 's' overrides this ligature mechanism so that it is possible to typeset an isolated σ without it becoming a ς. Because of this we make sure its lowercase code is not changed.

```
\addto\extrasgreek{%
  \babel@savevariable{\lccode‘v}\lccode‘v=‘v%
  \babel@savevariable{\lccode‘\’}\lccode‘\’=‘\’%
  \babel@savevariable{\lccode‘\"}\lccode‘\"=‘\"%
}
\addto\extraspolutonikogreek{%
  % \l@greek=\bbl@polygreek
  \babel@savevariable{\lccode‘\<}\lccode‘\<=‘\<%
  \babel@savevariable{\lccode‘\>}\lccode‘\>=‘\>%
  \babel@savevariable{\lccode‘\~}\lccode‘\~=‘\~%
  \babel@savevariable{\lccode‘\|}\lccode‘\|=‘\|%
  \babel@savevariable{\lccode‘\‘}\lccode‘\‘=‘\‘%
}
```

In order to process the suitable characters and in such a way that hyphenation patterns work also with precomposed characters, it is necessary to declare the lc code for all characters that can be part of a word. We do this in `\extrasgreek` because this is a feature of the LGR font encoding (used in all language variants). This means that multi-accented characters are regarded parts of a word (and not non-word characters) also in monotonic spelling.

```
\addto\extrasgreek{%
  % ‘‘high bit characters’’: set in a loop and correct exceptions
  \@tempcnta=128%
  \@whilenum\@tempcnta<253\do{%
    \expandafter\babel@savevariable\expandafter{%
                        \expandafter\lccode\the\@tempcnta}%
    \lccode\@tempcnta=\@tempcnta
    \advance\@tempcnta\@ne
  }%
  % Fix non-word characters:
  \lccode151=0%
  \lccode155=0%
  \lccode159=0%
  \lccode199=0%
  % Fix capital letters:
  \lccode195=147% GREEK LETTER DIGAMMA
```

```
    \lccode219=240% GREEK CAPITAL LETTER IOTA WITH DIALYTIKA
    \lccode223=244% GREEK CAPITAL LETTER UPSILON WITH DIALYTIKA
  }
```

In order to drop diacritics (eccept dialytika and sub-iota) in UPPERCASE also with the "input ligatures" the `\uccode` of the relevant characters is set to a dummy character. This is only done, if LaTeX is older than 2022/06/01 because the `\MakeUppercase` implementation introduced in this version ignores uccodes and fails with the "dummy" character 0x9f.

```
  % fallback for for LaTeX versions older than 2020-10-01
  \providecommand\IfFormatAtLeastTF{\@ifl@t@r\fmtversion}
  \IfFormatAtLeastTF{2022/06/01}%
    {}
    {% else
     \addto\extrasgreek{%
       \babel@savevariable{\uccode`\"}\uccode`\"=`\"%
       \babel@savevariable{\uccode`\'}\uccode`\'=159% 159 == ^^9f
     }
     \addto\extraspolutonikogreek{%
       \babel@savevariable{\uccode`\~}\uccode`\~=159%
       \babel@savevariable{\uccode`\>}\uccode`\>=159%
       \babel@savevariable{\uccode`\<}\uccode`\<=159%
       \babel@savevariable{\uccode`\|}\uccode`\|=`\|%
       \babel@savevariable{\uccode`\`}\uccode`\`=159%
     }
```

To avoid inputenc errors if the tilde is used as perispomeni (in polytonic or ancient Greek), we need to declare an expansion for the "dummy" character 0x9f = 159.[18] To be independent of inputenc, we do not use `\DeclareInputText` but code modelled after its definition to declare an empty expansion.

```
    \bgroup
       \uccode`\~159%
       \uppercase{%
    \egroup
       \def~{}%
    }
```

Add composite commands, so that the dialytika is kept or put on the following character of a diphthong with `\MakeUppercase` (see lgrdef.enc from the the greekfontenc package for details).

```
    \DeclareTextCompositeCommand{\"}{LGR}{^^9f}{\accdialytika}
    \DeclareTextCompositeCommand{\'}{LGR}{^^9f}{\LGR@hiatus}
    \DeclareTextCompositeCommand{\`}{LGR}{^^9f}{\LGR@accdropped}
```

If Unicode fonts are loaded together with LGR, we must also care for `\"'` and `\"`` in TU, because the ïs kept when upcasing.

```
    \ifdefined\UnicodeEncodingName % set by XeTeX/LuaTeX
      \DeclareTextCompositeCommand{\"}{TU}{^^9f}{\accdialytika}
```

[18] Since UTF-8 became the default encoding (cf. LaTeX News 28), an "inputenc" error is also thrown if the inputenc package is not loaded.

```
    \fi
  }% end of the \IfFormatAtLeastTF else block
```

`\bbl@greek@tilde` By default, the tilde produces an unbreakable space in text mode. In polytonic and ancient Greek, we change its meaning to allow using ~ in the Latin transliteration of characters with perispomeni. As the perispomeni is not required with monotonic Greek, this is only done for the variants "polutoniko" and "ancient" (in `\extraspolutonikogreek`).

Let the tilde character expand to a tilde with category code 12.

```
\DeclareTextSymbol{\bbl@greek@tilde}{LGR}{126}

\fi % End of LGR-specific code.
```

3.6 Symbol name aliases

For backwards compatibility, we keep aliases for a few symbols.

```
\providecommand*{\anwtonos}{\textdexiakeraia}
\providecommand*{\katwtonos}{\textaristerikeraia}
\providecommand*{\qoppa}{\textkoppa}
\providecommand*{\varqoppa}{\textqoppa}
\providecommand*{\stigma}{\textstigma}
\providecommand*{\sampi}{\textsampi}
\providecommand*{\Digamma}{\textDigamma}
\providecommand*{\ddigamma}{\textdigamma}
\providecommand*{\vardigamma}{\textvardigamma}
\providecommand*{\euro}{\texteuro}
\providecommand*{\permill}{\textperthousand}
\ProvideTextCommand{\textmugreek}{\greekfontencoding}{\textmu}
```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```
\ldf@finish{\CurrentOption}
```

⟨/code⟩

Change History

babel-greek-1.08

`\greekscript`: New TextCommands "greekscript" and "ensuregreek". 10

General: `greek.dtx` renamed to `babel-greek.dtx` (but still generates `greek.ldf`). 1

Check for EU1/EU2 font encoding instead of engine 9

Load `euenc.def` if EU1 or EU2 font encoding is detected. 9

Restore compatibility with Xe/LuaTeX in 8-bit and Unicode mode. 1

Use EU1 or EU2 for Latin script if available 11

Use font-encoding specific TextCommands. 12

Remove redefinition of `\fnum@figure` and

\fnum@table. 24
babel-greek-1.08a
\greekscript: Set 'encodingdefault' to fix Greek in footnotes etc. with document language Greek. . . . 10
babel-greek-1.09
General: Load correct hyphenation patterns (patch by Claudio Beccari). 6
Add support for ancient Greek. . 8
Added caption names for \ancientgreek 15
Added lc codes for chars 128 to 255 22
The ^-notation seems to require lower case letters. 23
babel-greek-1.09b
\captionspolutonikogreek: Use named macros instead of non-standard short accent macros for psili and dasia. . . . 15
General: Remove spurious whitespace from 'extrasgreek' definition (report Eike Schmidt). 22
babel-greek-1.09c
General: Fix dummy hyphenation language names (patch Ulrike Fischer). 6
babel-greek-1.09d
General: uc-/lccode corrections from xgreek are now in greek-euenc.def (the polyglossia version has bugs). 21
babel-greek-1.09e
General: Fix bug in lccode-setting loop (patch by Enrico Gregorio). 22
babel-greek-1.09f
General: Check also for standard Unicode text encoding "TU" (new in fontspec v2.5a). 9
babel-greek-1.09g
General: Babel 3.9i deprecated \textlatin and fixed \latinencoding. 1
babel-greek-1.09h
General: Move breathing composite commands to textalpha. 23
babel-greek-1.09i
\captionsgreek: Fix accent in seename and alsoname. 14
General: Fix accent in \seename and \alsoname. 1
Update check for Unicode fonts. 9
babel-greek-1.09j
\textampersand: Fix ampersand in math. 12
babel-greek-1.10
\greeknumeral: PDF-string secure implementation taken from "hyperref" (thanks to Ulrike Fischer). 18
\greeknumeralNinety: Use zig-zagy \textkoppa. This is what it looks in current Greek typography. 18
General: Load puenc-greek.def from greek-fontenc if used with hyperref. 10
Use TU with Xe/LuaTeX. 9
babel-greek-1.11
\greeknumeral: Configurable shapes for 6 and 90. 90 defaults to \textqoppa for ancient Greek. 18
General: Save/restore previous font encoding instead of switching to \latinencoding when leaving Greek. 11
babel-greek-1.12
\BabelGreekRestoreFontEncoding: New macro. 11
\EnsureStandardFontEncoding: New TextCommand. 12
\greek@Alph: Save/restore expansion of \alph and \Alph with every switch to/from Greek. 21
General: Declare char 159 expansion similar to inputenc to avoid "inputenc error". . . 23
Don't use \makeatother in \AtBeginDocument. 10
New language attribute polytonic (alias for polutoniko). . 8
New modifiers local-LGR-fixes and no-LGR-fixes. 3

Only change uc/lccodes if \greekfontencoding is LGR. 21
Only change uccodes if LaTeX is older than 2022/06/01. 23
Update and restructure documentation. 1
Drop definition for \SS. 12
Remove \textKoppa and \textmu (in greek-fontenc since version 1.0). 24
Save previous font encoding in \BabelGreekPreviousFontEncoding. 11

babel-greek-1.13
\bbl@greek@tilde: Renamed from \greek@tilde. Simplify definition. 24
General: Don't use text command in math mode. 9
New language attribute keep-semicolon. 9
Setup \languageshorthands for all language variants. 6

greek-1.0b
\lgrfont: Added a level of braces to keep encoding change local 11
General: Use \LdfInit to perform initial checks. 6
Moved the definition of \atcatcode right to the beginning 1
Now use \ldf@finish to wrap up 24
Replaced \undefined with \@undefined and \empty with \@empty for consistency with LaTeX 1

greek-1.0c
\bbl@greek@tilde: Added command 24

greek-1.1
\Grtoday: Added macro \Grtoday 18

greek-1.1a
\dategreek: Fixed typo, Oktwbr'iou instead of Oktobr'iou 17
\greek@Alph: removed two superfluous @'s which made \@alph undefined 21

greek-1.1b
\bbl@greek@tilde: Made tilde expand to a tilde with \catcode 12. 24
General: Added shorthand for \char255 23
Added setting of \uccodes (after kdgreek.sty) 23

greek-1.1c
General: Added a couple of symbols, needed for \greeknumeral 24
fixed two typos 22

greek-1.1d
\dategreek: Macro \gr@month now produces the name of the month 17

greek-1.1e
\gr@month: Macro added 16
General: Shorthand is changed. Active character is now \char159 23
Added caption name for proof 14
Added lowercase code for v . . . 22
Added uppercase code for special letter "v". Uppercase code for accents is now 9f, instead of ff 23
Most symbols are removed and are now defined in package grsymb 24

greek-1.2
\gr@polutoniko@month: Added macro \datepolutonikogreek 17
Added macro \gr@cl@month . . 17
General: Added caption names for \polutonikogreek 15
Added lowercase codes for "modern" greek 22
Added uppercase codes for "modern" Greek. The old codes are now for "Polutoniko" Greek 23
Classical Greek is now a dialect 1
Definitions for "modern" Greek are now the definitions of "polutoniko" Greek 22

greek-1.2a
\dategreek: Use \edef to define \today 17

General: Need shorthand to exist for monotonic Greek, not polytonik Greek 23
filename lgrenc.def now lowercase 9
greek-1.2b
\dategreek: use \def instead of \edef 17
General: Classical Greek is now called “Polutoniko” Greek. The previous name was at least misleading 1
greek-1.2c
General: Package grsymb has been eliminated because the CB fonts v2.0 do not inlcude certain symbols and so the remaining symbol definitions have been moved here 24
This version conforms to version 2.0 of the CB fonts and consequently we added a few new symbol-producing commands 1
greek-1.2e
General: Moved redefinition of \@roman back to the language specific file 13
greek-1.3a
\gr@polutoniko@month: removed macro \datepolutonikogreek 17
General: polutoniko is now an attribute to Greek, no longer a ‘dialect’ 1
greek-1.3d
General: \@roman and \@Roman need to be added to \extraspolutonikogreek . . . 13
Fixed typo, bl’epe ep’ishc instead of bl’pe ep’ishc . . . 14
greek-1.3e
General: \@roman and \@Roman need *not* be in \extraspolutonikogreek when they are already in \extrasgreek 13
\extrasgreek and \extraspolutonikogreek should be complementary 22, 23
greek-1.3f
General: Added some code to make older documents work. 8
greek-1.3g
General: \noextraspolutonikogreek was missing. 8
greek-1.3h
\captionsgreek: Added \glossaryname 14
\providehyphenmins: Now use \providehyphenmins to provide a default value 7
greek-1.3i
\captionsgreek: The final sigma in all names appears as ‘s’ instead of ‘c’. 14
General: uc code of ‘v’ is switched to V so that mixed text appears correctly in headers. . 23
greek-1.3j
General: Use the tilde as an alias for character 159 23
Don’t use the double caret notation here, because other languages might make the caret active. 23
greek-1.3k
\bbl@greek@tilde: Make sure the character ‘’ is not active during the definition of \greek@tilde 24
\lgrfont: Added \leavevmode as was done with \latintext . . 11
greek-1.4
\bbl@greek@tilde: Do not re-define the tilde accent macro: it works as expected with lgrenc.def from greek-fontenc. 24
General: lgrenc.def moved to the separate package ‘greek-fontenc’ 9
Add TextCompositeCommands for “uppercase diacritics”. . . . 23
moved here from lgrenc.def because the definitions require the \latintext macro defined by Babel. 12
new maintainer 1

greek-1.5
\textampersand: Make \& a TextCommand 12
General: \@roman and \@Roman as TextCommands (BUG: this extended the expansion problem to all languages) . . . 13
bugfixes, change some symbol macros to aliases, LGR fixes via \DeclareTextCommand instead of extrasgreek/noextrasgreek definitions, LICR macros in string definitions, LGR font encoding not used with XeTeX/LuaTeX. 1
change symbol macros to aliases 24
enable use of "textcomp" characters for "textcopyright" and "textregistered" macros . 12
LGR not used with XeTeX/LuaTeX. 11
LGR setup skipped with XeTeX/LuaTeX 9
Support XeTeX/LuaTeX. 21
greek-1.5a
General: provide \extraspolutonikogreek also for Xe/LuaTeX. 7
Replaced non-printable literal character with ^-notation (tip by Heiko Oberdiek). 23
greek-1.6
General: Apply a patch by Enrico Gregorio. Thanks to Claudio Beccari for testing and reporting. 13
fix \@roman and \@Roman redefinition (thanks to Enrico Gregorio and Claudio Beccari), load LICR macro definitions for Xe/LuaTeX. 1
greek-1.7
General: Do not load euenc.def with XeTeX/LuaTeX (too complicated to get it right). . . . 9
Do not load euenc.def with XeTeX/LuaTeX. Prevent re-loading lgrenc.def. 1
greek-1.7a
General: Remove spurious "fi". . . . 1
greek-1.7b
General: Correct upcasing of babel strings with Xe/LuaTeX. 1
greek-1.8
General: Renamed to 'babel-greek'. 1
greekfdd-2.2c
General: Fixed typos, \textrademark misses a 't', \copyright should be \textcopyright 12
greekfdd-2.2d
General: removed redefinition of \& 12
