A key aim of releasing ‘stable’ \LaTeX{}3 material to CTAN is to allow users to benefit from new ideas now, and also to raise the profile of usable \LaTeX{}3 ideas. This is clearly being successful, with xparse being of particular utility to end users. This increase in interest has been particularly notable on the new TeX.SX Q&A site.

The \LaTeX{}3 Team expands

Raising interest in \LaTeX{}3 developments has inevitably led to feedback on cases where the code base has required attention. It has also attracted new programmers to using \LaTeX{}3 ideas, some more than others! Bruno Le Floch has over the past few months made many useful contributions to \LaTeX{}3, and we are very pleased that he has recently joined The \LaTeX{} Project. Bruno has taken a particular interest in improving the performance and reliability of the expl3 language. This has already resulted in new implementations for the prop and seq data types. At the same time, he has identified and fixed several edge-case issues in core expl3 macros.

The ‘Big Bang’

In parallel to Bruno’s improvements, Joseph Wright initiated a series of ‘Big Bang’ improvements to \LaTeX{}3. The aim of the Big Bang was to address a number of long-standing issues with the \LaTeX{}3 code base. Development has taken place over many years, with the status of some of the resulting code being less than clear, even to members of The \LaTeX{} Project! At the same time, different conventions had been applied to different parts of the code, which made reading some of the code rather ‘interesting’. A key part of the Big Bang has been to address these issues, cleaning up the existing code and ensuring that the status of each part is clear.

The arrangement of \LaTeX{}3 code is now the same in the development repository and on CTAN, and splits the code into three parts.

\texttt{\textbullet{3kernel}} The core of \LaTeX{}3, code which is expected to be used in a \LaTeX{}3 kernel in more or less the current form. Currently, this part is made up of the \LaTeX{}3 programming layer, expl3.

\texttt{\textbullet{3packages}} \LaTeX{}3 2ε packages making use of \LaTeX{}3 concepts and with stable interfaces. The xparse and xtemplate packages are the core of this area. While many of the ideas explored here may eventually appear in a \LaTeX{}3 kernel, the interfaces here are tied to \LaTeX{}2ε.

\texttt{\textbullet{3experimental}} \LaTeX{}3 2ε packages which explore more experimental \LaTeX{}3 ideas, and which may see interface changes as development continues. Over time, we expect code to move from this area to either \texttt{\textbullet{3kernel}} or \texttt{\textbullet{3packages}}, as appropriate.

In addition to these release areas, the development code also features a \texttt{\textbullet{3trial}} section for exploring code ideas. Code in \texttt{\textbullet{3trial}} may be used to improve or replace other parts of \LaTeX{}3, or may simply be dropped!

As well as these improvements to the code used in \LaTeX{}3, much of the documentation for expl3 has been made more precise as part of the Big Bang. This means that \texttt{source3.pdf} is now rather longer than it was previously, but also should mean that many of the inaccuracies in earlier versions have been removed. Of course, we are very pleased to receive suggestions for further improvement.

\LaTeX{}3 on GitHub

The core development repository for \LaTeX{}3 is held in an SVN repository, which is publicly viewable via the Project website. However, this interface misses out on some of the ‘bells and whistles’ of newer code-hosting sites such as GitHub and BitBucket. We have therefore established a mirror of the master repository on GitHub\textsuperscript{1}. This is kept in synchronisation with the main SVN repository by Will Robertson (or at least by his laptop!).

The GitHub mirror offers several useful features for people who wish to follow the \LaTeX{}3 code changes. GitHub offers facilities such as highlighted differences and notification of changes. It also makes it possible for non-Team members to submit patches for \LaTeX{}3 as ‘pull requests’ on GitHub.

As well as offering a convenient interface to the \LaTeX{}3 code, the GitHub site also includes an issue database\textsuperscript{2}.

Given the very active nature of \LaTeX{}3 development, and the transitory nature of many of the issues, this provides a better approach to tracking issues than the main \LaTeX{} bug database\textsuperscript{3}. Developers and users are 

\begin{footnotesize}
\begin{itemize}
\item \textsuperscript{1}http://github.com/latex3/svn-mirror
\item \textsuperscript{2}http://github.com/latex3/svn-mirror/issues
\item \textsuperscript{3}http://www.latex-project.org/bugs.html
\end{itemize}
\end{footnotesize}
therefore asked to report any issues with \LaTeX\x3 code 
via the GitHub database, rather than on the main 
Project homepage. Discussion on the \LaTeX-L mailing 
list is also encouraged.

**Next steps**

The ‘Big Bang’ involves making a number of changes 
to expl3 function names, and is likely to break at least 
some third-party code. As a result, the updates will 
not appear on the \TeX\ Live 2011 DVD release, but 
will instead be added to \TeX\ Live once regular updates 
restart (probably August).

Bruno is working on a significant overhaul of the l3fp 
floating-point unit for \LaTeX3. He has developed an 
approach which allows expandable parsing of floating-
point expressions, which will eventually allow syntax 
such as

\begin{verbatim}
  \fp_parse:n { 3 * 4 ( ln(5) + 1 ) }
\end{verbatim}

This will result in some changes in the interface for 
floating-point numbers, but we feel that the long-term 
benefit is worth a small amount of recoding in other 
areas.

Joseph has completed documentation of the xgalley 
module, and this is currently being discussed. Joseph 
is hoping to move on to implement other more visible 
ideas based on the xtemplate concept over the next few 
months.
